Client Brief – Online Food Delivery Platform

Dear Software Development Team, I am planning to launch an online food delivery platform that connects customers with restaurants in their area. The website should provide a seamless experience for customers, restaurant owners, and administrators. Key Requirements:

- Attractive landing page highlighting featured restaurants and promotions.

- Customer registration, login, and profile management.
- Restaurant listings with menus, pricing, ratings, and reviews.
- Advanced search and filtering based on cuisine, location, and price range.
- Shopping cart and secure online payment integration.
- Real-time order tracking and order history for customers.
- Restaurant dashboard to manage menus, orders, and business information.
- Admin panel to manage users, restaurants, payments, and reports.
- Notification system for order updates and promotional offers.
- Responsive design that works efficiently on mobile phones, tablets, and desktops.
- Strong security measures to protect customer and payment information.

The platform should be scalable to support a growing number of restaurants and users. I also expect proper testing, deployment support, and complete project documentation before the final handover. Regards,

Client
